IT IS A BONE REMODELLING DISCADE MITH CLIMICAL SIMILARITIES TO FEO. UNLIKE FEO, HOWEVER, AFFECTED INDIVIDUALS HAVE INVOLVEMENT OF THE AXIAL SKELETON WITH LESIONS IN THE SPINE, PELVIS AND SKULL. SIMILARITY: CONTAINS 4 TNFR-CYS REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SKELETAL MUSCLE, THYMUS, LIVER, COLON, SMALL INTESTINE AND A GLAND.

DISEASE: DEFECTS IN TNERSF11A ARE THE CAUSE OF FAMILIAL EXPAOSTEDLYSIS (FEO), A RARE AUTOSOMAL DOMINANT BONE DISORDER CHARACTERIZED BY FOCAL AREAS OF INCREASED BONE REMODELLING.

CHARACTERIZED BY FOCAL AREAS OF INCREASED BONE REMODELLING.

OSTEOLYTIC LESIONS DEVELOP USUALLY IN THE LONG BONES DURING ADULTHOOD. FEO IS OFTEN ASSOCIATED WITH EARLY ONSET DEAFNESS LOSS OF DENTITION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Genet. 24:45-48(2000).

Genet. 24:45-48(2000).

FUNCTION: RECEPTOR FOR FANK LIGAND (RANKL; ALSO KNOWN AS FUNCTION: RECEPTOR FOR FANK LIGAND (RANKL; ALSO KNOWN AS OSTEOCLAST DIFFERENTIATION FACTOR OR ODF), ESSENTIAL FOR RAIMEDIATED OSTEOCLASTOGENESIS. INVOLVED IN THE REGULATION OF INTERACTIONS BETWEEN T-CELLS AND DENDETTIC CELLS.

SUBCELLULAR LOCATION: Type I membrane protein (Potential).

TISSUE SPECIFICITY: UBIQUITOUS EXPRESSION WITH HIGH LEVELS

                                                           "The role of polar interactions in the molecular recognit: with its receptor CD40.; with its receptor CD40.; protein Sci. 7:1124-1135(1998).

-I- FUNCTION: RECEPTOR FOR A CYTOKINE LIGAND KNOWN AS CD40-1- SUBCELLULAR LOCATION: Type I membrane protein.
-I- TISSUE SPECIFICITY: B-CELLS AND IN PRIMARY CARCINOMAS
-I- SIMILARITY: CONTAINS 4 THER-CYS REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SEQUENCE FROM N.A.

SUBCELULIAR LOCATION: Type I membrane protein (Potential).
TISSUE SPECIFICITY: UBIQUITOUS EXPRESSION WITH HIGH LEVELS IN
TRABECULAR BONE, THYMUS, SMALL INTESTINE, LUNG, BRAIN AND KIDNEY.
WEAKLY EXPRESSED IN SPLEEN AND BONE MARROW.
SIMILARITY: CONTAINS 4 TNER-CYS REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     s SWISS-PROT entry is copyright. NATURE 398:535-538(1999).

NATURE 398:535-538(1999).

PERMOXIMATELY 5-FOLD LOWER AFFINITY FOR TNF-BETA.

SUBCELLULAR LOCATION: Type I membrane protein.

PTM: PHOSPHORYLATED, MAINLY ON SERINE RESIDUES WITH A VERY LOW LEVEL ON THREONINE RESIDUES.

PARAMACEUTICAL: Available under the name Embrel (Immunex and Wyeth-Ayerst). Used to treat moderate to servere rheumatoid arthritis (RA). Embrel consist of the extracellular ligand-binding portion of TNFR2 linked to an Immuglabulin Fc chain. It binds to TNFR2 linked to an Immuglabulin Fc chain. It binds to TNFR2 lipha and blocks its interactions with receptors.

SIMILARITY: CONTAINS 4 TNFR-CYS REPEATS.

PATABASE: NAME-PROW; NOTE-CD guide CD120b entry;

SUBUNIT: CAN FORM A HOMODIMER THROUGH DISULFIDE BOND FORMATION.

SUBCELLULAR LOCATION: Type I membrane protein.

PYM: N- AND O-GLYCOSYLATED AND IS PHOSPHORYLATED ON SERINE.

SIMILARITY: CONTAINS 4 TNFR-CYS REPEATS.

SIMILARITY: CONTAINS 1 DEATH DOMAIN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence encodes the full-length cell surface receptor ACT-4 isolated from activated CD4+ T-lymphocytes. The sequence may be expressed in e.g. COS-7 cells. The encoded protein, its ilgands or fragments, and antibodies may be used for the treatment of transplant rejection, graft-versus-host disease, autoimmune disease, etc.

The sbp and its fragments are useful in pharmaceutical compositions to modify a patient's immune response as well as having application in the treatment of transplant rejection, graft versus host disease, autoimmune disease, inflammation, infectious agents, HTLV infected cells or HIV. Specifically the sbd can be used to treat inflammatory bowel disease. The sbd can also be used for screening for immunomodulatory agents able to recognise ACT-4 and for monitoring activated CD4 positive cells or inhibiting infection of CD4 positive cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ligand,

The present invention describes the human TRID protein (tumour necrosis CC factor (TNF) related apoptosis inducing ligand (TRAII) receptor without CC intracellular domain, also referred to as tumour necrosis factor CC receptor 5 (TNF) also referred to as tumour necrosis factor CC entivities, and can be used in gene therapy. The TRID polynucleotides are useful for detecting complementary polynucleotides. TRID proteins and CC polynucleotides are useful in the treatment of tumours, resistance to CC parasite, bacteria and viruses, restenosis and graft versus host disease. CC and to prevent certain haematopoletic cells, to regulate antiviral responses CC and to prevent certain autoimmune diseases after stimulation of TRID by CC an agonist or TRAIL binding facilitator. The antibodies which bind TRID CC polynucleotides, proteins, antibodies, agonists and antagonists are cuseful for treating and/or preventing diseases (C cuseful in the diagnosis, treatment or prevention of: (a) cancer; CC useful in the diagnosis, treatment or prevention of: (a) cancer; CC is autoimmune discases associated with increased cor decreased associated with increased in CC comparison with TRID in the exemplification of the present invention. The present sequence represents a tumour necrosis factor receptor used in CC comparison with TRID in the exemplification of the present invention.

         antigen activated T-cells, especially, for example, CD4+ T-cells. A C human cDNA encoding the human OX-40 homologue was cloned as follows. Using the Experimental Autoimmune Encephalomyelitis model in rats the OX-40 antigen was identified (expressed on the surface of activated autoantigen-specific CD4+ T-cells present at the site of inflammation but absent on CD4+ T-cells at non-inflammatory sites) and cDNA encoding the antigen was isolated. PCR primers were designed and used to clone murine OX-40 cDNA by PCR from RNA isolated from murine CD4+ T-cells activated with concanavalin A. Then the murine OX-40 cDNA was used to probe a cDNA lambda gtl1 library from human activated T lymphocytes to obtain human OX-40 cDNA the sequence is also in SQ ID no. 1, but this sequence is not present the number of the normal color of the received by it are claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid encoding an activated T-cell antigen, Ox-40 - used develop prods. for detection and therapy of conditions mediated activated T-cells, eg. multiple sclerosis, rheumatoid arthritis,

                                This plasmid encoues an converge mutein fusion protein for and is used to express a soluble OX40/FC mutein fusion protein for use in detecting cDNA clones encoding a OX40 ligand. The FC fragment may be derived from human IgG1, and the plasmid may be used to transform the CV-1/EBNA (ATCC CRL 10478) monkey kidney celline. Culture supernatant was purified by affinity chromatography time. Culture supernatant was purified by affinity chromatography
                                                                                                                                                            New isolated DNA encoding the OX40 ligand polypeptide and host cells, used to produce recombinant ligand used prim. T cell culture, to modulate immune response etc.
